

# Notes For The Presenter

---

- The HTML Crash Course provides a prepackaged solution for introducing a wide range of HTML tags
- You may use the presentation as-is; you can also easily customize it
- You may wish to remove this slide
- Complete TechRepublic's free feedback form (for a chance to win a free TechRepublic title)

# HTML Crash Course

---

## Understanding HTML Tags

# What is HTML?

---

- HTML stands for *Hyper Text Markup Language*
- HTML defines the design and layout of a Web document by using a variety of tags and attributes
- HTML is straight ASCII text and you can create HTML documents with Notepad

# What are HTML Tags?

---

- HTML tags are essentially commands that Web browsers use to determine how to display a document
- HTML tags are enclosed in brackets

<HTML tag>

# HTML Tag Sets

---

- Each tag is actually a set that comprises a beginning and a closing tag
- The closing tag is preceded by a forward slash

<Beginning tag>

</Closing tag >

# Essential HTML tags

---

- In order to create an HTML document, you only need to use these four tags:

`<html>`

`</html>`

`<head>`

`</head>`

`<title>`

`</title>`

`<body>`

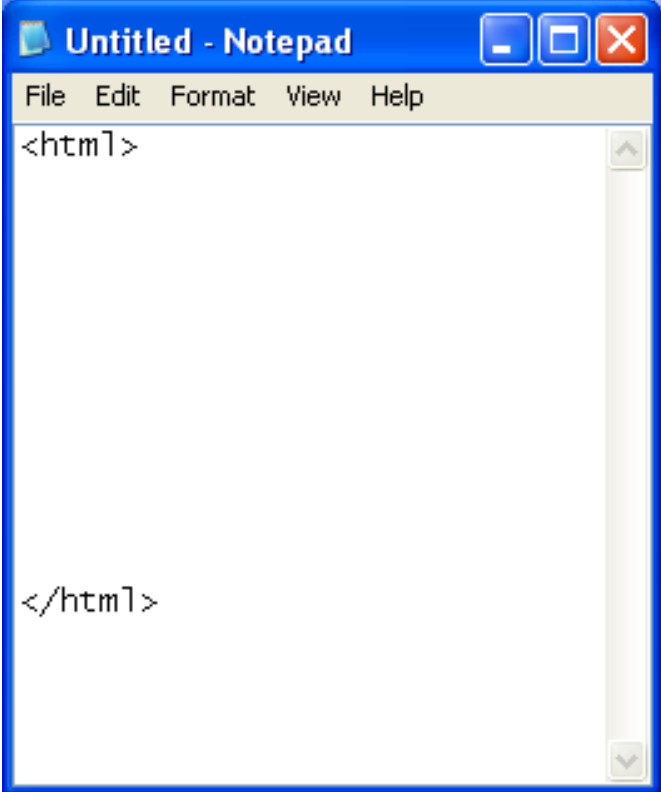

`</body>`

# The <html> Tag

---

- The <html> tag is the first thing that appears in an HTML document and the </html> tag is the last

```
File Edit Format View Help
<html>

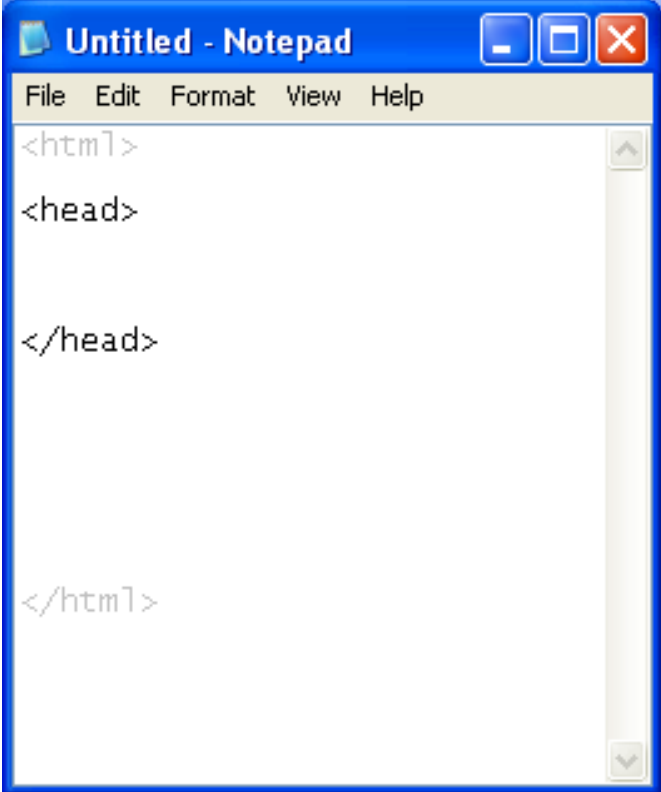

</html>
```

# The <head> Tag

---

- The <head> tag demarcates the header section of an HTML document

```
File Edit Format View Help
<html>
<head>

</head>

</html>
```

# The <title> Tag

---

- The <title> tag displays the document title in the title bar of the browser

```
File Edit Format View Help
<html>
<head>
<title> </title>
</head>

</html>
```

# The <body> Tag

---

- The <body> tag demarcates the main section of an HTML document

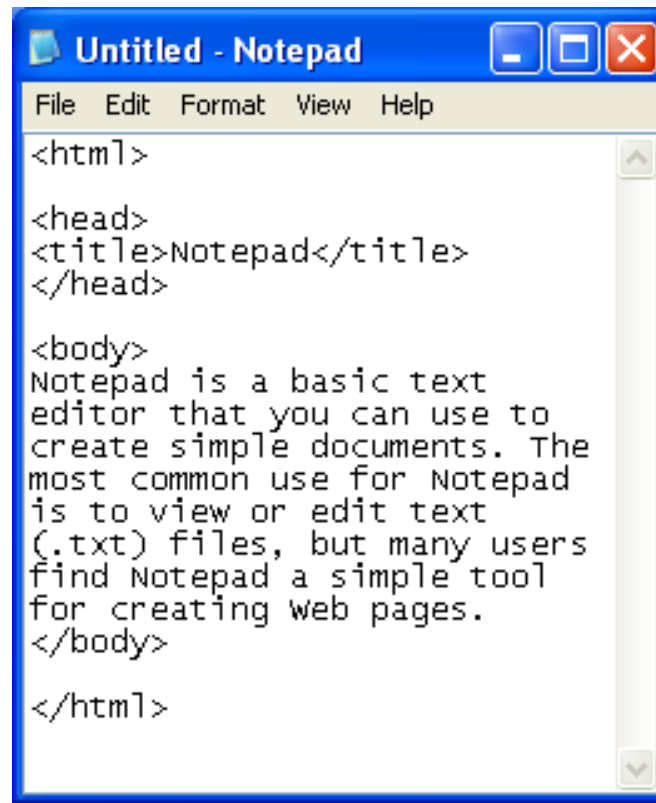

```
<html>
<head>
<title> </title>
</head>
<body>

</body>
</html>
```

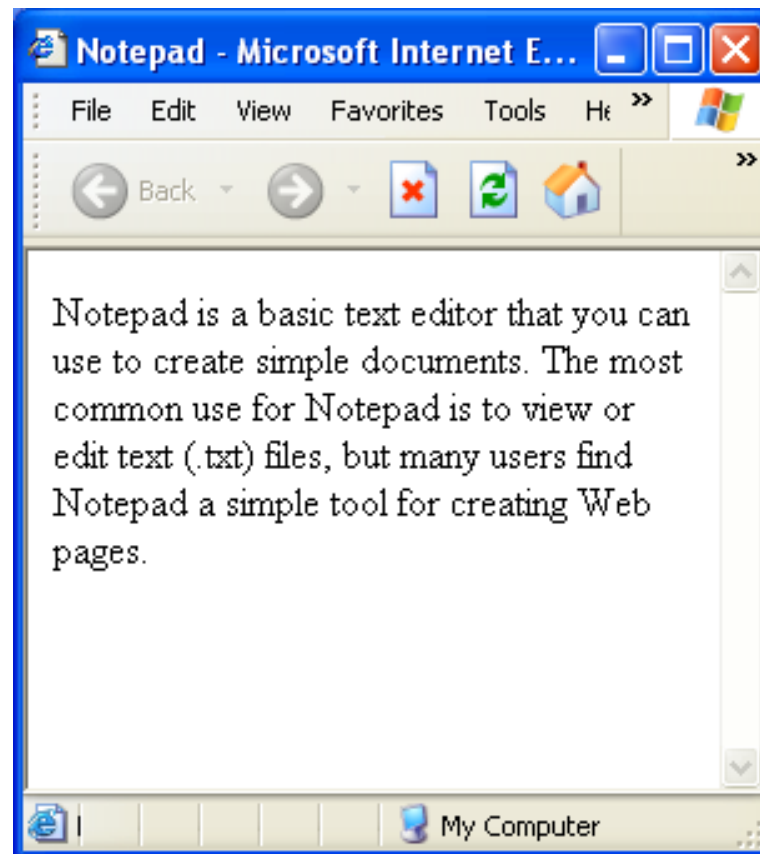

# A Basic HTML Document

---

```
File Edit Format View Help
<html>
<head>
<title>Notepad</title>
</head>
<body>
Notepad is a basic text
editor that you can use to
create simple documents. The
most common use for Notepad
is to view or edit text
(.txt) files, but many users
find Notepad a simple tool
for creating web pages.
</body>
</html>
```

# A Basic HTML Document

# Creating Links

---

- To link your HTML document to another document or Web site, you use the `<a href=>` and `</a>` tags

```
<a href="URL">label</a>
```

# Link Example

---

- To create a link to the TechRepublic site

To go to TechRepublic:

```
<a href="http://www.techrepublic.com">
```

```
Click Here</a>
```

To go to TechRepublic: [Click Here](http://www.techrepublic.com)

# Using Images

---

- To add an image to an HTML document you use the `<img>` tag and the `src=` attribute
- This tag doesn't have a separate closing tag

```

```

# Adding a Border

---

- You use the border= attribute to frame an image

```
<img src= "thepicture.jpg" border= "4">
```

# Sizing an Image

---

- You can use the width= and height= attributes to resize an image

```
<img src= "thepicture.jpg" border="4" width="160"  
height="120">
```

# Paragraph Tags

---

- To separate text or images, you use the opening and closing paragraph tags `<p></p>`

`<p>These lines will be</p>`

`<p>separated by a blank line</p>`

# Line Break Tag

---

- To separate text or images, you also use the line break tag `<br>`

These three lines  
will appear one  
right after the other

# Formatting Text

---

- You use the `<font>` tag along with the `face=`, `size=`, and `color=` attributes to enhance text

```
<font face="tahoma" size="4" color="#ff0000" >  
Hello there! </font>
```

Hello there!

# Header Tags

---

- You use header tags `<h#>` `</h#>` for titles and section headings

`<h1>Heading 1</h1>`

`<h2>Heading 2</h2>`

`<h3>Heading 3</h3>`

`<h4>Heading 4</h4>`

`<h5>Heading 5</h5>`

`<h6>Heading 6</h6>`

**Heading 1**

**Heading 2**

**Heading 3**

**Heading 4**

**Heading 5**

**Heading 6**

# Specifying Colors

---

- Hexadecimal color codes consist of 6 characters from the hexadecimal number system preceded by the # symbol
- Hexadecimal color codes are considered “Browser-Safe”

# Color Charts

---

- You can find “Browser-Safe” color charts on the Internet

 Aqua #00FFFF	 Black #000000	 Blue #0000FF	 Fuchsia #FF00FF
 Gray #808080	 Green #008000	 Lime #00FF00	 Maroon #800000
 Navy #000080	 Olive #808000	 Purple #800080	 Red #FF0000
 Silver #C0C0C0	 Teal #008080	 White #FFFFFF	 Yellow #FFFF00

# Special Characters

---

- To create special characters you use tags called character entity references or entities

<code>&amp;copy;</code>	copyright
<code>&amp;reg;</code>	trademark
<code>&amp;frac14;</code>	one quarter
<code>&amp;frac12;</code>	one half
<code>&amp;pound;</code>	pound
<code>&amp;nbsp;</code>	non-breaking space

# Special Characters

---

- You can also use decimal character references in entities

&#169;	copyright
&#174;	trademark
&#188;	one quarter
&#189;	one half
&#163;	pound
&#160;	non-breaking space

# Creating Tables

---

- You create a basic table using the `<table>`, `<tr>`, `<th>` and `<td>` tags

```
<table>  
  <tr> <th> </th></tr>  
  <tr> <td> </td></tr>  
</table>
```

# Using Borders

---

- You add the border= attribute to the <table> tag to frame your table

```
<table border="2">
```

# Adding White Space

---

- You add the `cellspacing=` and `cellpadding=` attributes to the `<table>` tag to add white space to your table

```
<table cellspacing="2" cellpadding="4">
```

# Example Table

---

```
<table border="2" cellspacing="2" cellpadding="4" >
  <tr> <th>Year</th> <th>Sales</th> </tr>
  <tr> <td>2004</td> <td>$100K</td> </tr>
  <tr><td>2005</td><td>$200K</td> </tr>
</table>
```

Year	Sales
2004	\$100K
2005	\$200K

# Creating Forms

---

- To create a form for soliciting user feedback, you'll use the `<form>` tag along with its associated attributes
- The `<input>` tag allows you to create text boxes, radio buttons, and check boxes

# Specifying Scripts

---

- Forms use the `action=` and `method=` attributes to direct the data they contain to a script that will process the data

```
<form method="post"  
  action="http://dom.com/cgi/sendapp.cgi">
```

# Creating a Text Box

---

- To create a text box, you use the `<input>` tag along with the `type="text"` attribute

Name:

```
<input type="text" name="Name" size="30">
```

# Creating Radio Buttons

---

- To create a radio buttons, you use the `<input>` tag along with the `type="radio"` attribute

Gender:

```
<input type="radio" name="gender" value="M">Male
```

```
<input type="radio" name="gender" value="F">Female
```

# Creating Check Boxes

---

- To create a check boxes, you use the `<input>` tag along with the `type="checkbox"` attribute

Education Level:

```
<input type="checkbox" name="ELevel"  
value="H">High School
```

```
<input type="checkbox" name="ELevel"  
value="C">College
```

# Action Buttons

---

- To create action buttons, you use the `<input>` tag along with the `type="submit"` and `type="reset"` attributes

```
<input type="submit">
```

```
<input type="reset">
```

# Example Form

---

```
<form method="post" action="http://dom.com/cgi/sendapp.cgi">
Name:
<input type="text" name="FullName" size="30"><br>
Gender:
<input type="radio" name="gender" value="M">Male
<input type="radio" name="gender" value="F">Female<br>
Education Level:
<input type="checkbox" name="ELevel" value="H">High School
<input type="checkbox" name="ELevel" value="C">College
<br><br>
<input type="submit">
<input type="reset">
</form>
```

# Example Form

---

Name:

Gender:  Male  Female

Education Level:  High School  College

# Creating Framesets

---

- To create a frameset you use the `<frameset>` tag along with the `cols=` and `rows=` attributes
- You use the `<frame>` tag along with the `src=` attribute to specify which HTML document is to appear in each frame

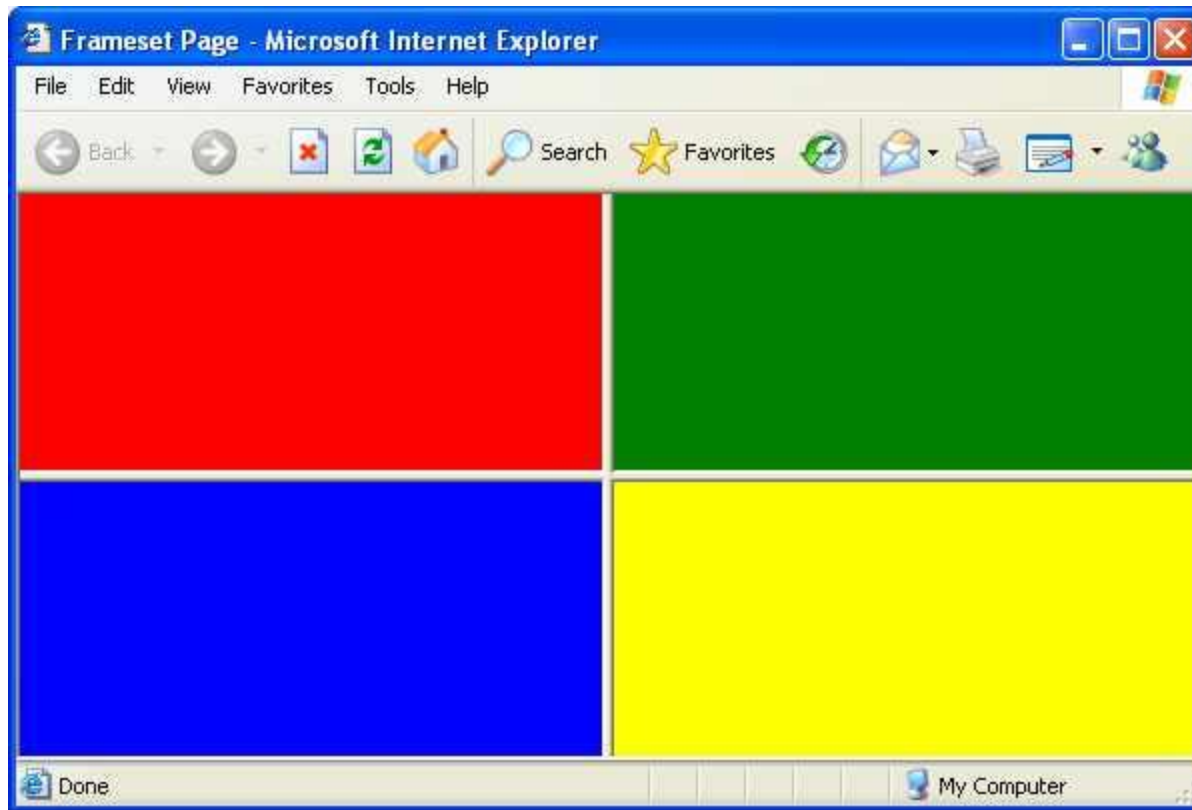

# Example Frameset

---

```
<html>  
<title>Frameset Page</title>  
  
<frameset cols="50%,50%" rows="50%,50%">  
  
<frame src="red-page.htm">  
<frame src="grn-page.htm">  
<frame src="blu-page.htm">  
<frame src="yel-page.htm">  
  
</frameset>  
  
</html>
```

# Example Frameset

# Cascading Style Sheets

---

- Using Cascading Style Sheets makes it easier to alter text in an HTML document by specifying style rules
- You can place the style rules in the header section of an HTML document

# Style Definitions

---

- The style definitions are defined within the `<style>` tag

```
<style type="text/css">  
tag {name: value; name: value}  
tag {name: value; name: value}  
</style>
```

# Common Tags

---

- The most common tags defined in a Cascading Style Sheet
  - h#
  - body
  - p

# Common Definitions

---

- The most common definitions used in a Cascading Style Sheet
  - font-family:
  - font-size:
  - font-style:
  - color:

# Example

## Cascading Style Sheet

---

```
<head>
```

```
<style type="text/css">
```

```
  h1 {font-family: tahoma; font-size: 18pt; color:  
      0000ff}
```

```
  p {font-family: georgia; font-size: 12pt; font-style:  
      italic}
```

```
</style>
```

```
</head>
```

# Example Cascading Style Sheet

---

## **Cascading Style Sheets**

*A Cascading Style Sheet acts as a master list of style definitions to which the HTML document refers when formatting text and layout throughout the document.*
